Elliptic Functions

Complex Elliptic Integrals

$\S6.1$ Complex elliptic integral of the first kind

Want: elliptic integrals $\int_C R(x,\sqrt{\varphi(x)}) \, dx$ with complex variables.

C: curve on the Riemann surface \mathcal{R} of $\sqrt{\varphi(z)}$,

or its compactification $\overline{\mathcal{R}}$ = the elliptic curve.

Let us begin with $\int \frac{dz}{\sqrt{\varphi(z)}}$, the elliptic integral of the first kind. $\omega_1 := \frac{dz}{\sqrt{\varphi(z)}} = \frac{dz}{w}.$ We know that ω_1 is holomorphic on

$$\mathcal{R} = \overline{\mathcal{R}} \smallsetminus \{\infty\} \ (\deg \varphi = 3) \text{ or } \mathcal{R} = \overline{\mathcal{R}} \smallsetminus \{\infty_{\pm}\} \ (\deg \varphi = 4).$$

How about the neighbourhood of ∞_{\pm} ?

Assume deg $\varphi = 4$: $\varphi(z) = a(z - \alpha_0)(z - \alpha_1)(z - \alpha_2)(z - \alpha_3)$. (The case deg $\varphi = 3$ is similar.) Recall:

- local parameter at $\infty_{\pm} = \xi = z^{-1}$.
- the equation of $\bar{\mathcal{R}}$ in the neighbourhood of ∞_{\pm} :

$$\eta^2 = a(1 - \alpha_0 \xi)(1 - \alpha_1 \xi)(1 - \alpha_2 \xi)(1 - \alpha_3 \xi),$$

where $\eta = w z^{-2}$.

• $\infty_{\pm} = (\xi = 0, \eta = \pm \sqrt{a} \neq 0).$

Consequently,

- $d\xi = -z^{-2} dz$.
- $\omega_1 = \frac{dz}{w} = -\frac{d\xi}{\eta}.$
- $\eta(\xi) = \sqrt{a(1-\alpha_0\xi)(1-\alpha_1\xi)(1-\alpha_2\xi)(1-\alpha_3\xi)}$: holomorphic in ξ .
- $\eta(\xi) \neq 0$ at ∞_{\pm} .
- $\implies \omega_1$ is holomorphic at ∞_{\pm} .

<u>Conclusion</u>: ω_1 is holomorphic everywhere on $\overline{\mathcal{R}}$.

Moreover,
$$\omega_1
eq 0$$
 everywhere on $ar{\mathcal{R}}$ ($\Longleftrightarrow \omega_1=rac{dz}{w}=-rac{d\xi}{\eta}$).

<u>Exercise</u>: Show that ω_1 is holomorphic everywhere and nowhere-vanishing in the case deg $\varphi = 3$.

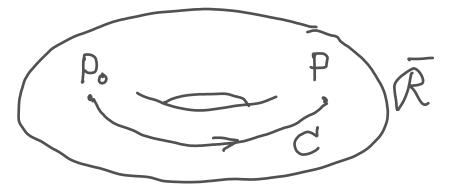

Fix $P_0 \in \overline{\mathcal{R}}$.

 ω_1 is holomorphic on $\overline{\mathcal{R}}$.

$$\implies F(P) := \int_{P_0 \to P} \omega_1 = \int_{C: \text{ contour from } P_0 \text{ to } P} \omega_1$$

is "locally" well-defined and holomorphic in P.

Figure of $\overline{\mathcal{R}}$ and C:

"F(P) is *locally* well-defined" = does not change by small change of C. Exactly speaking,

$$[C] - [C'] = 0 \text{ in } H_1(\bar{\mathcal{R}}, \mathbb{Z}) \Longrightarrow \int_C \omega_1 = \int_{C'} \omega_1.$$

Is F(P) "globally" well-defined?

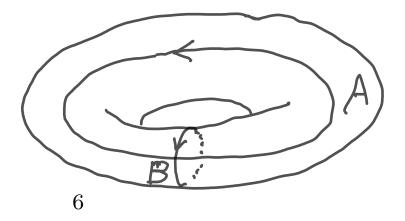

Need to know: How many "globally" different contours exist on $\overline{\mathcal{R}}$?

Answer from topology: $H_1(\overline{\mathcal{R}}, \mathbb{Z}) = \mathbb{Z}[A] \oplus \mathbb{Z}[B]$, which means:

for \forall closed curve C on $\overline{\mathcal{R}}$, $\exists ! m, n \in \mathbb{Z}$, such that

 $[C] = m[A] + n[B] \text{ in } H_1(\overline{\mathcal{R}}, \mathbb{Z}).$

Figure: *A*-cycle and *B*-cycle.

$$C_0, C_1: \text{ curves from } P_0 \text{ to } P.$$

$$\implies [C_1] - [C_0] = m[A] + n[B] \text{ for some } m, n \in \mathbb{Z}.$$

$$\int_{C_1} \omega_1 = \int_{C_0} \omega_1 + m \int_A \omega_1 + n \int_B \omega_1.$$

We call

$$\int_{A} \omega_1: A \text{-period of 1-form } \omega_1, \int_{B} \omega_1: B \text{-period of 1-form } \omega_1.$$

Let us compute A- and B-periods for the case $\varphi(z)=(1-z^2)(1-k^2z^2),$ i.e.,

$$\omega_1 = \frac{dz}{\sqrt{(1-z^2)(1-k^2z^2)}}.$$

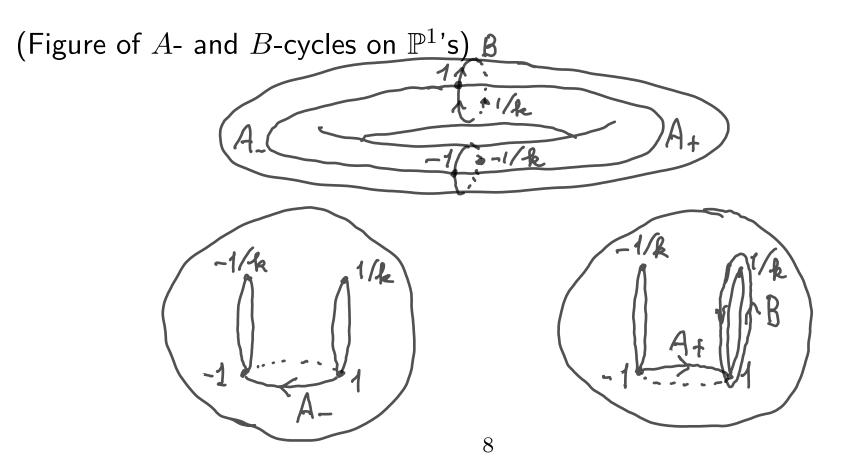

For simplicity, assume $k \in \mathbb{R}$, 0 < k < 1.

Recall the construction of $\overline{\mathcal{R}}$:

Two \mathbb{P}^1 's are glued together along cuts between two pairs of roots of $\varphi(z)$.

roots of $\varphi(z) = \pm 1, \pm k^{-1}$.

Cut \mathbb{P}^1 's along $[-k^{-1},-1]$ and $[1,k^{-1}]$ and glue.

Periods of ω_1 :

$$\int_A \omega_1 = 4 K(k), \qquad \int_B \omega_1 = 2i K'(k),$$

where

•
$$K(k) = \int_0^1 \frac{dx}{\sqrt{(1-x^2)(1-k^2x^2)}}$$
: complete elliptic integral of the first kind.

•
$$K'(k) := K(k')$$
, $k' := \sqrt{1 - k^2}$ (supplementary modulus).

<u>Proof</u>:

$$\int_{A} \omega_{1} = \int_{-1}^{1} \frac{dx}{+\sqrt{(1-x^{2})(1-k^{2}x^{2})}} + \int_{1}^{-1} \frac{dx}{-\sqrt{(1-x^{2})(1-k^{2}x^{2})}}$$
(Note: ± because of branches.)

$$= 4 \int_{0}^{1} \frac{dx}{\sqrt{(1-x^{2})(1-k^{2}x^{2})}} = 4 K(k).$$

$$\int_{B} \omega_{1} = \int_{1}^{1/k} \frac{dx}{+\sqrt{(1-x^{2})(1-k^{2}x^{2})}} + \int_{1/k}^{1} \frac{dx}{-\sqrt{(1-x^{2})(1-k^{2}x^{2})}}$$
$$= 2\int_{1}^{1/k} \frac{dx}{\sqrt{(1-x^{2})(1-k^{2}x^{2})}} = 2i\int_{1}^{1/k} \frac{dx}{\sqrt{(x^{2}-1)(1-k^{2}x^{2})}}$$

Change of the variable: $x = \frac{1}{\sqrt{1 - k'^2 t^2}}$, i.e., $x^2 = \frac{1}{1 - k'^2 t^2}$,

$$dx = \frac{k^{\prime 2}t}{(1 - k^{\prime 2}t^{2})^{3/2}}dt, \qquad (x^{2} - 1)(1 - k^{2}x^{2}) = \frac{k^{\prime 4}t^{2}(1 - t^{2})}{(1 - k^{\prime 2}t^{2})^{2}}.$$

Hence,

$$\int_{B} \omega_1 = 2i \int_0^1 \frac{dt}{\sqrt{(1-t^2)(1-k'^2t^2)}} = 2i K(k') = 2i K'(k).$$

Remark:

- Signs of $\sqrt{}$ should be chosen carefully.
- For general $k \in \mathbb{C}$, the results are the same (analytic continuation).

Recall:

"A-period of
$$\frac{dz}{\sqrt{1-z^2}} = 2\pi = \text{period of } \sin(u)$$
."

Correspondingly,

A-period of
$$\frac{dz}{\sqrt{(1-z^2)(1-k^2z^2)}} = 4 K(k) = \text{period of } \operatorname{sn}(u)!$$

What is the role of the *B*-period 2i K'(k) for sn(u)?

 \longrightarrow Another period of $\operatorname{sn}(u)$, i.e., $\operatorname{sn}(u)$ is doubly-periodic!

Details will be discussed later...

 $\S6.2$ Complex elliptic integral of the second kind

$$\int \sqrt{\frac{1-k^2 z^2}{1-z^2}} \, dz = \int \frac{1-k^2 z^2}{\sqrt{\varphi(z)}} \, dz, \qquad \varphi(z) = (1-z^2)(1-k^2 z^2).$$

Corresponding Riemann surface $= \mathcal{R} = \{(z, w) \mid w^2 = \varphi(z)\}$ as before. The compactification $= \overline{\mathcal{R}}$: elliptic curve.

$$\omega_2 := \sqrt{\frac{1 - k^2 z^2}{1 - z^2}} \, dz = \frac{1 - k^2 z^2}{\sqrt{\varphi(z)}} \, dz = \frac{1 - k^2 z^2}{w} \, dz$$

is holomorphic on \mathcal{R} as ω_1 . (In particular, at $z = \pm 1, \pm k^{-1}$.)

How about at
$$\{\infty_{\pm}\} = \overline{\mathcal{R}} \smallsetminus \mathcal{R}$$
?

Local coordinate at $\pm \infty$: $\xi = z^{-1}$.

$$\begin{split} \omega_2 &= \sqrt{\frac{1-k^2\xi^{-2}}{1-\xi^{-2}}} \, d(\xi^{-1}) = \sqrt{\frac{\xi^2-k^2}{\xi^2-1}} \cdot (-\xi^{-2}) \, d\xi \\ &= -\xi^{-2}(\pm k + O(\xi^2)) \, d\xi = \left(\frac{\mp k}{\xi^2} + (\text{holomorphic at } \xi = 0)\right) \, d\xi. \end{split}$$

 $\implies \omega_2$ has double poles at ∞_{\pm} without residues: $\operatorname{Res}_{\infty_{\pm}} \omega_2 = 0$.

$$\implies G(P) := \int_{P_0 \to P} \omega_2 = \int_{C: \text{ contour from } P_0 \text{ to } P} \omega_2 \quad \text{is}$$

- locally well-defined.
- holomorphic in P except at ∞_{\pm} .

• has a simple pole at
$$\infty_{\pm}$$
: $G(P) = \pm \frac{k}{\xi} + (\text{holomorphic at } \xi = 0).$

Global multi-valuedness: same as the case of ω_1 .

 $C_{0}, C_{1}: \text{ curves from } P_{0} \text{ to } P.$ $\implies [C_{1}] - [C_{0}] = m[A] + n[B] \text{ for some } m, n \in \mathbb{Z}.$ $\int_{C_{1}} \omega_{2} = \int_{C_{1}} \omega_{2} + m \int_{A} \omega_{2} + n \int_{B} \omega_{2}.$ $\int_{A} \omega_{2}: A\text{-period of } \omega_{2}, \quad \int_{B} \omega_{2}: B\text{-period of } \omega_{2}.$

<u>Exercise</u>: Express A- and B-periods of ω_2 in terms of the complete elliptic integral of the second kind.

 $\S6.3$ Complex elliptic integral of the third kind

$$\int \frac{dz}{(z^2 - a^2)\sqrt{\varphi(z)}}, \qquad \varphi(z) = (1 - z^2)(1 - k^2 z^2).$$

$$\omega_3 := \frac{dz}{(z^2 - a^2)\sqrt{\varphi(z)}} = \frac{dz}{(z^2 - a^2)w}$$

is holomorphic on the elliptic curve (including ∞_{\pm}) except at four points:

$$(z,w) = (\pm a, \pm \sqrt{(1-a^2)(1-k^2a^2)}).$$

These are *simple poles*.

Exercise: (i) Check these facts. (ii) Compute the residues at poles.

$$H(P) := \int_{P_0 \to P} \omega_3$$

multi-valued in the neighbourhood of simple poles because of the residue.

(And, of course, globally multi-valued.)

 \implies H(P) is a very complicated function.

<u>Remark</u>:

A meromorphic 1-form ω on a Riemann surface is called an *Abelian* differential. It is

- of the first kind, when ω is holomorphic everywhere.
- of the second kind, when the residue is zero at any pole.
- of the third kind, otherwise.

 $\implies \omega_1$: the first kind, ω_2 : the second kind, ω_3 : the third kind.

(There are several differnent definitions; e.g.,

- "the third kind" has only simple poles',
- "the second kind" has only one pole of order ≥ 2 ', etc.)
